```

It is easy to implement Decision Tree with numerical values. We can convert all the non numerical values into numerical values using LabelEncoder

no

True

high

```
In [4]: from sklearn.preprocessing import LabelEncoder
Le = LabelEncoder()

PlayTennis['outlook'] = Le.fit_transform(PlayTennis['outlook'])
PlayTennis['temp'] = Le.fit_transform(PlayTennis['temp'])
PlayTennis['humidity'] = Le.fit_transform(PlayTennis['humidity'])
PlayTennis['windy'] = Le.fit_transform(PlayTennis['windy'])
PlayTennis['play'] = Le.fit_transform(PlayTennis['play'])
```

```
In [5]: PlayTennis
```

Out[5]:

	outlook	temp	humidity	windy	play
0	2	1	0	0	0
1	2	1	0	1	0
2	0	1	0	0	1
3	1	2	0	0	1
4	1	0	1	0	1
5	1	0	1	1	0
6	0	0	1	1	1
7	2	2	0	0	0
8	2	0	1	0	1
9	1	2	1	0	1
10	2	2	1	1	1
11	0	2	0	1	1
12	0	1	1	0	1
13	1	2	0	1	0

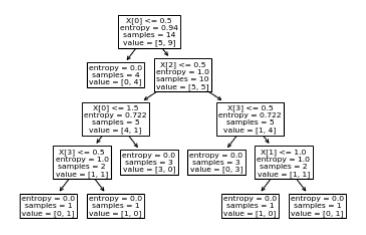

Methodology

- Lets split the training data and its coresponding prediction values.
- y holds all the decisions.
- X holds the training data.

```
In [6]: y = PlayTennis['play']
X = PlayTennis.drop(['play'],axis=1)

In [7]: # Fitting the model
    from sklearn import tree
    clf = tree.DecisionTreeClassifier(criterion = 'entropy')
    clf = clf.fit(X, y)
```

```
In [8]:
                                                            # We can visualize the tree using tree.plot tree
                                                             tree.plot_tree(clf)
Out[8]:
                                                           [Text(133.9200000000000, 195.696, 'X[0] <= 0.5\nentropy = 0.94\nsamples =</pre>
